

PRODUCT ROADMAP · v1.0

Flate

Where the terminal goes next — by theme, not by date

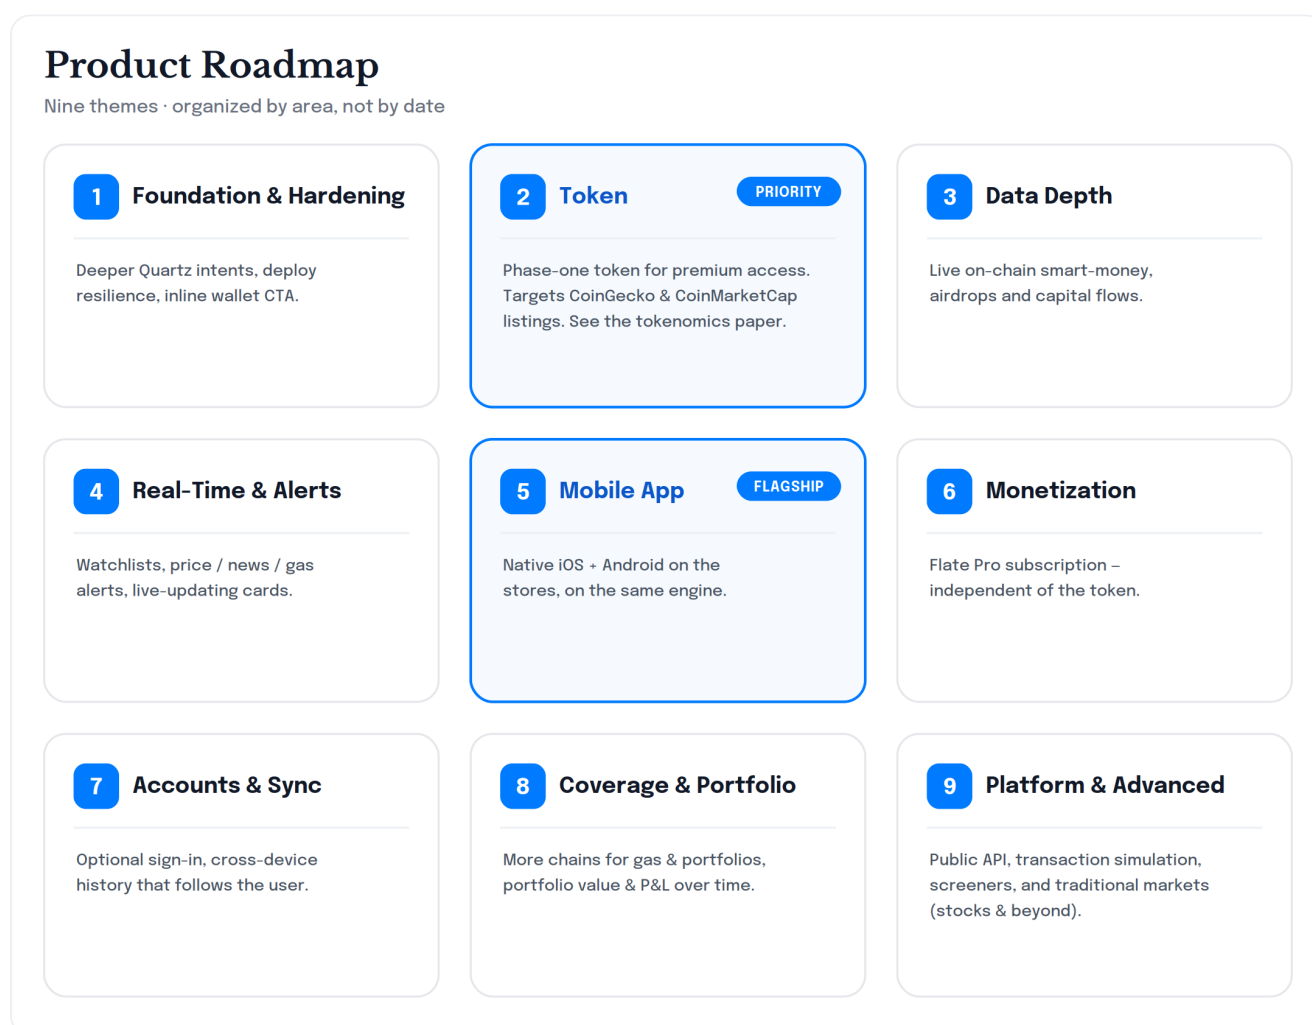

How to read this roadmap

This roadmap is organized **by theme, not by date**. It describes where Flate is headed and in what order of priority – not when each item will ship. Like the whitepaper, everything here is forward-looking: direction and intent, not a commitment.

Two anchors orient everything else: the **token** is the priority first move once the product is in users' hands, and the **mobile app** is the flagship product expansion. Each item carries two quick tags:

- **Value** – expected impact for the user: *High · Medium · Low*
- **Lift** – implementation effort: *High · Medium · Low*

Together they separate quick wins (high value, low lift) from big bets (high value, high lift).

The roadmap at a glance – nine themes, ordered by priority, not by date. Token is the priority first move; the mobile app is the flagship expansion.

1. Foundation & Hardening

Low-lift work that compounds: more deterministic coverage in Quartz and a sturdier deploy path, so most queries stay instant, free, and reliable.

- **Expanded Quartz intents** – where-to-buy / exchange listings, stablecoin de-peg checks, three-or-more-coin comparisons, all-time-low stats, token unlock and vesting schedules. *Value: High · Lift: Low*
- **Deploy resilience** – full provider fallback across all environments. *Value: Medium · Lift: Low*
- **Inline "Connect wallet" CTA** – surfaced when an answer would benefit from a connected wallet. *Value: Medium · Lift: Low*

2. Token — *priority*

The Flate token is a phase-one strategic move once the product is live. At a high level it powers **premium access** to the terminal's higher tiers and premium data, with **governance under exploration**. Its full mechanics – supply, allocations, and utility – are out of scope here and are covered in a dedicated **tokenomics paper**.

- **Flate token** – powers premium access to higher tiers and premium data. *Value: High · Lift: High*
- **CoinGecko & CoinMarketCap listings** – get the token listed on the major price trackers for visibility and credibility. *Value: High · Lift: Low*
- **Governance** – being explored as a token utility. *Value: Medium · Lift: Medium*

3. Data Depth

Replace curated datasets with live, on-chain intelligence – the largest single jump in the product's analytical value.

- **Real-time on-chain smart-money & flows** – live analytics in place of the curated dataset. *Value: High · Lift: High*
- **Live airdrop tracking** – live status in place of curated entries. *Value: High · Lift: Medium*
- **Capital-flow / sector rotation** – derived from live data. *Value: Medium-High · Lift: Medium*

4. Real-Time & Alerts

Move from request/response toward a system that watches the market for the user.

- **Watchlists** – track tokens and wallets of interest. *Value: High · Lift: Medium*

- **Price / news / gas alerts** – threshold-based notifications with a scheduler. *Value: High · Lift: High*
- **Live-updating cards / streaming** – websocket-driven prices and market view. *Value: High · Lift: High*

5. Mobile App — *flagship*

The signature expansion: Flate in your pocket, on the same engine.

- **Native iOS + Android apps** – published on the App Store and Google Play, reusing the same engine (Quartz + the AssistantResponse contract). *Value: High · Lift: High*

6. Monetization

A revenue path that stands on its own, independent of the token.

- **Flate Pro (subscription)** – higher limits, alerts, and premium data. *Value: High · Lift: Medium*

7. Accounts & Sync

Optional identity, layered on top of the existing per-device cookie – never replacing the frictionless default.

- **Optional sign-in** – built on the existing cookie identity. *Value: Medium · Lift: Medium*
- **Cross-device history sync** – history that follows the user. *Value: Medium · Lift: Medium*

8. Coverage & Portfolio

Broaden the chains Flate sees and give portfolios a time dimension.

- **More chains** – gas and portfolios beyond Ethereum. *Value: Medium · Lift: Medium*
- **Portfolio value over time** – wire the portfolioValueChart block to a balance-history source, with profit-and-loss. *Value: High · Lift: Medium*

9. Platform & Advanced

Turn the engine into a platform and add power features for advanced users.

- **Public API** – expose the AssistantResponse engine to developers. *Value: High · Lift: High*
- **Transaction simulation** – "explain this transaction or contract." *Value: High · Lift: High*

- **Traditional markets** – extend the same research engine beyond crypto to stocks, ETFs, and broader markets. *Value: High · Lift: High*
 - **Screeners** – filter tokens and wallets by on-chain criteria. *Value: Medium · Lift: Medium*
-

The destination does not change as these themes land: **answers, not links – and numbers that are computed, not guessed**, on every surface Flate reaches.
